Sequence 5, Application US/09315689

Patent No. 6345510

GENERAL INFORMATION:

APPLICANT: Folkman, Usdah

APPLICANT: O'Reilly, Michael

TITLE OF INVENTION: Therapeutic Antiangiogenic Endostatin Compositions

FILE REFERENCE: 05213-0229

CURRENT APPLICATION UNMER: US/09/315,689

CURRENT FILING DATE: 1999-05-20

NUMBER OF SEQ ID NOS: 6

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                         1239

Proc. Natl. Acad. Sci. U.S.A. 89:10144-10148 (1992).

-I TISSUE SPECIFICITY: Expressed predominantly in internal organs such as advenial gland, pancreas and kidney.

-I THE PROJINES ALL THE TIBLE Desition of the tripeptide repeating unit (G-X-Y) are hydroxylated in some or all of the chains.

-I SIMILARITY: BELONGS TO THE FIRRIL-ASSOCIATED COLLAGENS WITH INTERRUPTED FILICES (FACIT) FAMILY.

-I SIMILARITY: COLTAIN 1 TSP N-terminal (TSPN) domain.

--- TISSUE SPECIFICITY: Widely expressed throughout the body.
--- POLYMORPHISM: The poly-Gin region of SCA1 is highly polymorphic (
--- POLYMORPHISM: The poly-Gin region of SCA1 is highly polymorphic (
--- POLYMORPHISM: The poly-Gin region of SCA1 is repeats in scal patients. Longer expanded to about 40-83 repeats in scal patients. Longer expanded to about earlier onset and more severe clinical manifestations of the
                                                                                                                                                                                      Hum. Moi. Genet. 10:25-30(2001).
-!- FUNCTION: Binds RNA in vitro. May be involved in RNA metabolism.
The expansion of the polyglutamine tract may alter this function.
-!- SUBGNIT: Interacts with LANP and AlU.
-!- SUBCELLULAR LOCATION Nuclear and cytoplasmic (By similarity).
-!- ALTERNATIVE PRODUCTS:

DNA Res. 9:189-197(2002).

- CATALYTIC ACTIVITY: Homogentisate + O(2) = 4-maleylacetoacetate.

-! CATALYTIC ACTIVITY: Homogentisate + O(2) = 4-maleylacetoacetate.

-! PATHWAX: Catabolism of tyrosine; third step.

-! PATHWAX: Catabolism of phenylalanine; fourth step.

-! SIMILARITY: Belongs to the homogentisate dioxygenase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           10-OCT-2003 (Rel. 42, Created)

- FUNCTION: Transcriptional regulator (By similarity).

- FUNCTION: Transcriptional regulator (By similarity).

- FUNCTION: Transcriptional regulator (By similarity).

- SUBCELLULAR LOCATION: Nuclear (Probable).

- INDUCTION: BY PHA/PMA OR BY SERUM.

- SIMILARITY: BELONGS TO THE EGR FAMILY OF C2H2-TYPE ZINC-FINGER

- FOOTEINS.

- SIMILARITY: Contains 3 C2H2-type zinc fingers.

StAR-realated lipid transfer protein 13 (StARD13) (START domain-
containing protein 13) (46H23.2)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Hunt A.;
Substited (OCT-2001) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: May function as a GTPase-activating protein.
-!- SIMILARITY: Contains 1 Rho-GAP domain.
-!- SIMILARITY: Contains 1 START domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              y Match 6.6%; Score 82; DB 1; Length 995; Local Similarity 23.0%; Pred. number of results predicted by chance to have a the No. Pred.

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

An isolated nucleic acid molecule for the treatment of angiogenesis-

```
The present invention provides the protein and coding sequences of canine pro-endostatin and endostatin. The sequences can be used in the treatment and diagnosis of angiogenesis related disorders, including cancer, rheumatoid arthritis, psoriasis, retinopathy, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasia, rubeosis, olsier-webber Syndrome, myocardial angiogenesis, plaque neovascularisation, telanguectasia, hemophiliac joints, angiofibroma, wound granulation, coronary collaterals, cerebral collaterals, necessularisation, and fractures. The present sequence is the canine endostatin coding sequence
  such as cancers or diabetic retinopathy, encodes an
                                                                   Claim 2; Fig 4; 56pp; English.
                      endostatin protein.
